

**SYSK: HOSPITALITY**

**LIQUID OF LIFE LLC**

**By Rukhsana Kausar, founding partner, Liquid of Life**

**Company profile**

Liquid of Life LLC is the premier provider of alternative drinking water solutions in the region, assisting businesses in reducing administration and operational costs associated with plastic bottled drinking water.

**What's new for this year?**

The majority of drinking water is provided by using 5 gallon or single-use plastic bottles which is costly both to the environment and on an administrative and operational level for many FM providers. Liquid of Life LLC implements a number of point-of-use water purifiers/dispensers that provide a healthier alternative to bottled water.

The bottle-free units with the in-built water filtration system are connected directly to an existing water supply. Using filters manufactured in the USA, tested and accredited by NSF and ANSI, the water is purified, mineralised and then kept heated and chilled ready to be dispensed for drinking. The mineral content of the water dispensed exceeds the quality of most bottled water, and the filters ensure that the quality of the water dispensed remains consistent. All the dispensers have a service agreement, which guarantees the units are properly maintained every year and come with a 5-year guarantee on the refrigeration.

As the units are all Blue Energy Star rated, they consume 45% less energy than conventional water coolers.

Implementing the units allows FM providers to reduce the waste generated through use of plastic bottles.

**Past projects**

Liquid of Life LLC solutions have been installed in various gym facilities across the UAE

and in hotels including Radisson Hotel, Yas Island.

More recently a bottle-free system was installed in the Bewei Lounge that offers its clients a non-invasive body sculpting treatment with a key emphasis on drinking plenty of fresh filtered water as part of its treatment process.

**Why choose Liquid of Life LLC?**

The units are modern and sleek in design and come in a range of finishes including real wood, brushed aluminum and stainless steel. The fantastic appearance allows for the dispensers to be a feature - front and back of house. No longer is a water dispenser an eyesore, it can be a value-adding feature to public areas, such as club houses, gyms, spas and cafeterias.

They are quick and easy to install, with a t-junction on the nearest mains water supply, being all that is needed. There is no need for time consuming PPR piping, as genuine John Guest quick push-fit fittings and piping is used. The piping can therefore be quickly dismantled and the units moved to other locations if necessary with the minimum amount of hassle.

Ongoing running costs include filter changes every 10,000 litres and maintenance of the units. Some FM providers are now enjoying annual savings of up to 80% against the previous cost of bottled water. Furthermore, as a result of implementing the units, FM providers will reduce their carbon footprint and the water footprint associated with their plastic bottled water consumption.
